How does sample approval work?

▾Show the full pipeline

1. **Submitted.** The requester creates the request and the lifecycle strip above shows it on the left. Nothing is approved yet.
2. **Finance review.** The finance admin confirms the grant / account code. If the instrument is charged per use, the rate is locked at this step.
3. **Professor approval.** The requester's supervising professor signs off on the scientific intent. This step can be skipped if the requester already holds operator-level access.
4. **Instrument admin schedule.** The operator group owning the instrument picks a slot, marks the sample received, and queues the job. Only users in the operator group for this instrument see this step.
5. **Run + results.** The operator runs the sample, attaches result files to the Activity tile above, and marks the request complete. The audit chain is updated and the queue advances.
6. **Completed.** Requester, professor, finance, and operators can all see the result files. A completed request is immutable except for a flagged re-open by the owner role.

This default text is editable by admins in a later patch (v1.3.2). For now, it is the canonical description of how a sample travels through the system.
